

Project Development Phase

GenAI Functional & Performance Testing

Date	12-07-2026
Team ID	SWTID-2026-9948
Project Name	Heart Disease Analysis
Maximum Marks	

Test Scenarios & Results

Test Case ID	Scenario (What to test)	Test Steps (How to test)	Expected Result	Actual Result	Pass/Fail
FT-01	Filter Input Validation (Age Category, Gender, Race, etc.)	Select valid and invalid/blank filter combinations on the dashboard	Valid filter selections update visuals correctly; invalid/empty selections show no data gracefully		
FT-02	Numeric Range Validation (BMI, Age)	Apply BMI/Age range filters within and outside available data range	Accepts valid ranges; shows empty state for out-of-range values		
FT-03	Dashboard Rendering	Load each dashboard page (demographics, lifestyle risk factors, health/BMI)	All charts, legends and tables render correctly with correct data		
FT-04	Data Source Connection Check	Refresh/reload the dashboard and confirm the data source connects successfully	Dashboard connects and refreshes successfully		
PT-01	Response Time Test	Use a timer to measure dashboard/page load time	Should load under 3 seconds		
PT-02	Filter Interaction Speed Test	Apply multiple filters/cross-filter clicks in quick succession	Dashboard should not slow down or lag		
PT-03	Story Navigation Load Test	Click through Previous/Next story navigation repeatedly	Should transition smoothly between pages without crashing		

Note: This project is a Tableau analytics dashboard, not a GenAI/LLM application. Test scenarios have been adapted from the GenAI functional/performance testing template to fit dashboard filter, rendering and load-time testing. Actual Result and Pass/Fail columns are left for the team to complete after running each test.
